

# Idesco ID: File Transfer

Distribute mobile credentials in bulk process

Idesco ID Service File Transfer level is for organisations that prefer migrating to mobile access in a single step, avoiding a tedious credential issuing process. File Transfer also avoids any need for an ongoing connection between your access control system and Idesco ID service. It utilizes data that your access control system exports in a file, which Idesco ID then formats for distributing credentials to users' phones. Users following instructions sent to their phones will register their mobile credential, instantly making their phone ready for accessing. When registrations are finally completed, all user data are removed from the service.

This lets you manage and delete mobile credentials in your system exactly the same way you manage physical credentials, making File Transfer a cost-effective way to migrate to mobile access, since you only pay for the one-time credential transfer.

- User and credential data management remain confined to your access control system
- No parallel system needed for mobile credential management
- Idesco ID mobile phone app is free
- Idesco ID app can host multiple, independent credentials to different sites
- Idesco ID mobile phone app is available for both Android and iOS devices
- Idesco ID service and app both compatible with your system's installed 8 CD 2.0 MI readers

## What is needed?

Customer account	Your customer account is where you specify data needed for creating mobile credentials
Compatible RFID reader	8 CD 2.0 MI
Mobile phone app	Idesco ID (Google Play or AppStore)
